Drive, Stourbridge, DY8 4JB**

PULMONARY REHABILITATION

What is pulmonary rehabilitation?

When you have a long-term problem, you can find it increasingly difficult to move about and do your normal daily activities without getting breathless. Pulmonary Rehabilitation aims to help you cope with your breathlessness and to feel stronger and fitter. Breathlessness can be frightening and just one bad experience can mean that people start to avoid situations where they might become breathless and so reduce the amount of activity they do. This can slowly cause weakness, tiredness and even more breathlessness.

Pulmonary Rehabilitation can help prevent this.

How does Pulmonary Rehabilitation help?

Pulmonary Rehabilitation should:

Improve your exercise ability. You may find yourself walking further, managing day-to-day activities easier; such as washing, dressing and shopping. You are likely to feel less tired too.

Help you cope with your breathlessness. It is very frightening to become breathless and Pulmonary Rehabilitation should help you to manage your breathlessness and have more control.

It is important to know that Pulmonary Rehabilitation can help to increase muscle strength and endurance, improve co-ordination and increase your understanding of your breathlessness, It is however unlikely to change your lung function as measured by a Spirometer.

What happens during Pulmonary Rehabilitation?

In Dudley, the Pulmonary Rehabilitation programme consists of an initial assessment for us to gain a “baseline” measure of your ability. The course then runs over a period of 6 weeks; twice a week with mixed groups of approx 12 people.

Each session consists of a warm up for five to ten minutes, then supervised exercises such as the exercise bike, walking, step, and a circuit with weights (*you will not be expected to do anything that you are unable to do*) followed by a cool down for five minutes.

The exercise session is completed with a relaxation session.

Following on...

Following on from the exercises is an educational talk with topics including:

- How the lungs work and what can go wrong
- Airway clearance techniques
- Benefits of exercise
- Managing breathlessness
- Benefits
- Travel
- Coping with lung disease
- Medication education
- Dietary advice

If you are interested in attending and haven't already been referred please speak with your GP or practice nurse to be referred.
